

CHAIN SLING RECOVERY TOOL

Use this tool to push & pull chains and slings while performing underwater recovery operations on submerged vehicles. With this tool your reach is extended enabling a diver to reach into areas where a chain or sling is just out of reach. It also helps keep a diver from having to get underneath unstable objects to place or remove chains, & slings. Tow truck operators also use this tool in much the same way as divers to avoid placing their bodies in precarious positions under unstable vehicles or other objects.

Because the handle is slightly offset, a diver can determine which direction the hook is facing when using the tool in no, or low visibility conditions. The tool is manufactured from 3/8" round aluminum alloy, and resists corrosion and oxidation.

The tool measures 22 3/4 inches over all. Across the handle 5 1/2 inches, and across the hook 3 inches

Order 1 – 5@ \$31.20 USD each
