

S-SUN DIVER HEAD LIGHT

The S-Sun Diver Head Light is a compact bright five Led dive light. The light is produced by super white led's that produce 500 candle power. The light will burn for approximately 12 hours on two double AA batteries. The light output is considerably brighter then what you would expect from a light its size. The light comes with an articulated mount that can be worn on the included head strap, or on the strap of a conventional dive mask. A wrist lanyard and Velcro strap are also included. This light works extremely well with the innovative dive equipment AGA Accessory Rail System.

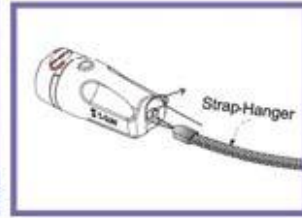

The light is rated to 165' of sea water, and it has a unique pushbutton on/off switch. The first time the switch is pressed the light is on full power. Press the switch again, and the light is now operating on reduced out put. The third time the switch is pressed, the light goes into a flashing mode (distress). On more press of the button turns the light off. Another feature of the switch is that if it is pressed and held for 5 seconds, the switch is deactivated to prevent the light from turning on if the button is accidentally depressed while in storage, or packed in dive bag while traveling to a dive site. Holding the button depressed for 5 seconds will return the light to the normal operating mode.
